This seems to be related to changing my ole provider, or something similar. I'm using the Generic.NET Framework 2.0 How can I get a better idea as to what's going on? My main problem is to fix this error, since it's preventing me from uploading my asp.net application. The reason for this is that I am required to use the asp.net framework, because the next version of the application uses a different framework, so I need to migrate. A: This link points you to the right direction. This error comes up when the user has a lot of history on their system. I was able to resolve this with the following. Stop IIS (use Task Manager) Delete the following files under "C:\Users\Me\AppData\Local\Temp" IISConfigModules\iis-apphosts iis-apphosts-lock.dll Start IIS, and you should be able to access your site. Q: How to find the max element of std::vector? In C++ 11, std::max\_element returns the first element that is greater than the max element in the vector, which is not what I want. Is there any other way to achieve this? That is correct, std::max\_element is non-deterministic: Finds the maximum element in the range [first,last). Elements of the range that compare equal are not modified. The returned value refers to the maximum element in the range, as if it were returned by a call to the built-in max function. For non-random access iterators (most of the time), you can simply use vector::max\_element() std::vector v{ 0, 5, 7, -2, 9, 8, -1, 2, 6 }; auto max\_value = std::max\_element(v.begin(), v.end()); // max\_value = {9, -1, 2, 6} for (const auto& x: v) { std::cout ForwardIterator max\_element(ForwardIterator first 82157476af
